SWIFTLOG LOGISTICS LTD

# Executive BI Report

Logistics, Customer, Revenue and Operational Performance

Reporting period: 1 January 2026 – 8 September 2026
Prepared from the SwiftLog Power BI dashboard

## 1. Executive Summary

This report summarises the business insights visible in the SwiftLog Logistics Ltd Power BI dashboard. It reviews sales and customer performance, warehouse and inventory indicators, and shipment delivery reliability. The purpose is to help management identify where performance is strong, where operational attention is required, and which actions should be prioritised.

The dashboard records 5,000 orders, 5,000 shipments and approximately 1,000 customers. Total revenue is shown as 21.67M, with 82K units sold and an average order value of 4.33K. The most significant operational concern is delivery reliability: 3,186 shipments were delayed and 1,814 were on time. This equates to a delayed shipment rate of 63.72% and an on-time delivery rate of 36.28%.

The warehouse views also show variation in shipment volumes and delay rates. Warehouse W07 handled the highest shipment volume shown (371), while W13 handled the lowest (279). W05 has the highest displayed warehouse delay rate at 67.96%, making it a priority for investigation. These results identify where management should investigate further; the dashboard alone does not establish the causes of delays.

### Key dashboard indicators

| Indicator | Dashboard figure |
|---|---|
| Total orders | 5,000 |
| Total shipments | 5,000 |
| Total customers | 1,000 |
| Total products | 250 |
| Total revenue | 21.67M |
| Total units sold | 82K |
| Average order value | 4.33K |
| Average delivery delay | 3.57 days |
| Delayed shipment rate | 63.72% |
| On-time delivery rate | 36.28% |

## 2. Customer and Revenue Analysis

The Customer Analysis dashboard shows total revenue of approximately 5.7M for Kano, 5.5M for Lagos, and 5.2M each for Abuja and Ibadan. Kano has the highest displayed total revenue, while Abuja and Ibadan have the lowest displayed values. Overall, the differences are relatively small compared with total revenue across the four cities.

Average revenue per customer is displayed as approximately 22K for Kano, Lagos and Abuja, and 20K for Ibadan. This suggests an opportunity to examine customer purchasing patterns, product mix and repeat purchasing in Ibadan. The dashboard does not by itself explain why the city averages differ.

## Customer concentration

The top revenue-generating customer visual identifies Customer 263 at approximately 74K, followed by Customers 815 and 512 at approximately 70K each. Customer 223 follows at approximately 69K, while Customer 597 generated approximately 65K. These customers may warrant retention-focused engagement, while management should assess whether revenue depends disproportionately on a small group of customers before deciding on a specific retention strategy.

## Category Revenue

Total revenue by category is approximately 8.06M for Fashion, 7.11M for Food and 6.50M for Electronics. Fashion generates the highest revenue, followed by Food and Electronics.

## Business implications

- Review city-level sales and customer behaviour to understand why Ibadan's displayed average revenue per customer is lower.
- Use the top-customer list to assess customer concentration and opportunities for retention, without assuming that the top customers are at risk.
- Use category revenue performance to support inventory planning, marketing decisions and growth opportunities within high-performing categories.

# 3. Inventory, Warehouse and Delivery Performance

## Warehouse and inventory indicators

Warehouse shipment volumes vary across the network. W07 has the highest displayed volume at 371 shipments, while W13 has the lowest at 279. The distinct-products chart shows W12 with 174 distinct products recorded and W01 with 154. The aggregate recorded stock chart shows W12 at 78K and W01 at 57K. These are recorded stock quantities, not warehouse capacity or utilisation rates; capacity data is not shown in the dashboard.

Differences in shipment volume, product range and recorded stock provide a basis for reviewing warehouse workload and inventory distribution. They do not prove that a warehouse is over-capacity, under-resourced or inefficient. Staffing, space capacity, processing time and stock availability would need to be considered before drawing those conclusions.

## Delivery reliability

The dashboard reports an average delivery delay of 3.57 days.

By location, the delayed-shipment chart shows 1,701 delayed shipments for Lagos, 849 for Abuja and 636 for Kano. The location delay-rate chart shows Lagos at 64.26%, Abuja at 63.60% and Kano at 62.48%. These are meaningful operational signals, but the counts and rates should be interpreted alongside the total shipment volumes in each location.

## Priority warehouse for investigation

W05 has the highest displayed warehouse delay rate at 67.96%. Its detail view shows 334 total shipments and 227 delayed shipments. W09 and W03 follow with displayed delay rates of 67.47% and 67.44%. W05 is therefore a reasonable starting point for a structured review of dispatch processing, staffing by shift, inventory availability, carrier hand-offs and route-level performance. These are investigation areas, not confirmed causes.

## Returns

The dashboard reports 500 returns. Late Delivery accounted for 185 returns, followed by Wrong Item at 163 and Damaged at 152. These findings suggest that delivery reliability, fulfilment accuracy and product handling should all be included in the returns improvement programme.

# 4. Recommendations and Implementation Priorities

The following recommendations are linked to the dashboard findings. Proposed targets are starting points for management discussion, not existing company commitments; they should be confirmed against operational baselines and business capacity.

### 1. Establish a delivery improvement programme

Prioritise reducing delayed shipments, currently 63.72%, and improving the on-time delivery rate, currently 36.28%. Review delay patterns by location, warehouse, route and delivery stage.

> KPIs: on-time delivery rate; delayed shipment rate; average delivery delay. Suggested initial target: improve on-time delivery by 10 percentage points over an agreed 3–6 month period.

### 2. Conduct a focused W05 performance review

Start with W05 because its displayed delay rate is 67.96% across 334 shipments, including 227 delayed shipments. Review shift-level workload, dispatch cut-off compliance, inventory readiness and carrier hand-off times.

> KPIs: W05 delay rate; delayed shipments; dispatch processing time. Set a reduction target after the cause analysis establishes a realistic baseline.

### 3. Investigate location-level delivery performance

Compare Lagos, Abuja and Kano using both delayed shipment counts and rates. Segment the data by route and shipment volume to avoid treating higher counts alone as worse performance.

> KPIs: delay rate by city; on-time delivery by city; average delay by route.

### 4. Review inventory allocation across warehouses

Compare recorded stock quantities, distinct products and shipment volumes. Investigate whether high-demand products are available where orders are being fulfilled; do not infer capacity utilisation from stock quantities alone.

> KPIs: stock by product and warehouse; stock-out frequency (if captured); order fulfilment rate.

### 5. Use category revenue insights to guide decisions

Use the category revenue results to support product planning. Maintain appropriate stock availability for high-performing categories and investigate category demand, profitability and sales trends before adjusting inventory or marketing allocation.

> KPIs: category revenue by product category; report refresh date; metric definition documented.

### 6. Investigate Ibadan customer value

The dashboard displays average revenue per customer of approximately 20K for Ibadan compared with approximately 22K in Kano, Lagos and Abuja. Compare order frequency, basket value and category mix before selecting an intervention.

> KPIs: average revenue per customer by city; orders per customer; average order value.

### 7. Review return reasons

Validate the counts for late delivery, wrong item and damaged goods, then analyse return rates by warehouse, product and delivery location if the data supports those joins.

> KPIs: return rate; returns by reason; wrong-item rate; damage-related return rate.

### 8. Monitor customer concentration

Review the share of revenue generated by the highest-value customers and consider appropriate service and retention practices. Avoid assuming concentration risk until the overall customer revenue distribution is calculated.

> KPIs: revenue share of top 10 customers; repeat purchase rate; customer retention rate.

### 9. Improve warehouse performance reporting

Track shipment volume, delay rate, recorded stock and distinct products together. Add staffing and processing measures where reliable data is available, and obtain warehouse capacity data before calculating utilisation.

> KPIs: shipment volume per warehouse; delay rate; stock quantity; products recorded; capacity utilisation only when capacity data exists.

### 10. Strengthen data quality and reporting governance

Document metric definitions, slicer behaviour, reporting dates and data limitations. Verify that dashboard pages use consistent measures where comparisons are intended and clearly label incomplete periods.

> KPIs: number of unresolved metric discrepancies; data refresh date; completeness checks passed; percentage of KPIs with documented definitions.

## 5. Limitations and Conclusion

This report is based on figures visible in the SwiftLog Power BI dashboard and screenshots. Some values are rounded in the visuals. September 2026 data is incomplete, with the dashboard showing data through 8 September. Exact return-reason counts and warehouse staffing/capacity details should be interpreted with care because the available dashboard does not provide all operational context.

The clearest priority is improving delivery reliability, supported by a focused review of W05 and location-level delay patterns. The evidence suggests that improving delivery performance offers the greatest immediate operational benefit, while customer retention and category growth represent the strongest commercial opportunities. In parallel, SwiftLog should review city-level customer value, evaluate growth opportunities in high-performing product categories and use warehouse stock and shipment indicators to guide further investigation. Management should track progress through clearly defined KPIs and avoid treating correlations as proven causes.
